

## WHAT IS CLAIMED IS :

1. An electric projection screen roller assembly comprising :

5 a main body being provided with a groove in one predetermined position of the upper facing surface, a flanged strip being provided adjacent to said groove, a hollow being provided adjacent to said flanged strip, a slant against block being provided at one predetermined position on the upper facing surface of said main body, a  
10 recess being provided at one side of said slant against block, and an inlaying socket being provided adjacent to said recess;and,

an inserting piece being provided with a flange at one side, a hollow being formed adjacent to said flange, a  
15 hook block being provided adjacent to said hollow, another hollow being formed adjacent to said hook block, and a curved against member being provided at the other side of said inserting piece and adjacent to said another hollow.

20 2. An electric projection screen balance rod assembly comprising :

a left half portion being provided with a pivotal flange at the bottom, a sliding groove being formed in the inner side of said pivotal flange, a protruding block being provided above said sliding groove, another hollow being  
25 formed above said protruding block, a slant against block

being provided above said another hollow, a recess being provided above said slant against block, and an inlaying socket being provided above said recess; and,

5 a right half portion being provided with a pivotal curved member at the bottom, a hollow being provided above said pivotal curved member, a hook member being provided above said hollow, another hollow being formed above said hook member, and a curved against member being provided above said another hollow.
